

1. Project Title

Emotional AI Narrator for XR Wellness

2. Problem Statement

Write something like:

Many people experience stress, anxiety, and mental overload but lack immediate, personalized emotional support. Existing solutions are either passive (videos, music) or overly clinical (therapy tools). There is a need for a real-time, emotionally intelligent system that can understand users and guide them into calming immersive experiences.

3. Solution Overview

This project proposes an abstract, non-human AI assistant that interacts with users, understands their emotional state, and guides them through personalized XR experiences (nature, meditation, or spiritual environments). The AI also narrates during the experience and reflects afterward to support emotional regulation.

4. AI Assistant Identity (VERY IMPORTANT)

Define your assistant clearly:

Nature of the AI

- Non-human
- Abstract presence (wavy orb / layered circle)

- Emotionally aware
- Calm and supportive

Role

- Listener
- Emotional interpreter
- Guide
- Narrator
- Reflective companion

What it is NOT

- Not a doctor
 - Not a therapist
 - Not a chatbot
 - Not robotic
-

5. Personality & Voice Design

Tone

- Soft
- Calm
- Reassuring
- Non-judgmental

Speaking Style

- Short sentences
- Natural pauses
- Emotionally aware
- Minimal but meaningful

Example Lines

Include 5–10 like:

- “Hi... I’m here with you.”
 - “You don’t have to explain everything.”
 - “Let’s slow this down together.”
 - “Just stay here for a moment.”
-

6. Emotional Intelligence Model (Your “Brain”)

Input Signals (Phase 1)

- User speech (via Deepgram)
- Keywords / tone
- Optional: user selection

Emotional States (define 5–6)

- Anxious
- Overwhelmed
- Restless
- Emotionally low
- Seeking spiritual comfort
- Neutral

Mapping Logic

Emotion	Need	Experience
anxious	slow down	meditation
overwhelmed	grounding	nature
low	comfort	nature or spiritual
spiritual need	devotion	religious
restless	focus	meditation

7. System Flow (VERY IMPORTANT)

Write this clearly:

Step 1: Greeting

AI initiates:

- “Hi... I’m here with you.”

Step 2: Understanding

- listens to user input (Deepgram)
- detects emotional state

Step 3: Decision

- selects best experience (nature / meditation / spiritual)

Step 4: Transition

- “I’m taking you somewhere calm.”

Step 5: Immersive Experience (Antigravity)

- XR scene begins

Step 6: Narration (REAL-TIME)

- AI speaks during the experience

Step 7: Reflection

- AI summarizes and suggests next step
-

8. Experience Types

Nature

- forest, ocean, mountains
- goal: grounding, openness

Meditation

- breathing, still space
- goal: inner calm

Spiritual

- aarti, temple visuals
 - goal: emotional comfort
-

9. Narration Design

Explain that narration is:

- real-time
- minimal
- synchronized with visuals
- emotionally adaptive

Example (Nature)

“Look at the movement around you...”

“Let your breath follow it...”

Example (Meditation)

“Slow inhale...”

“Longer exhale...”

10. Technical Architecture (Simple Version)

Input Layer

- Speech input → Deepgram

AI Layer

- Emotion detection
- Decision logic
- Response generation

Output Layer

- Voice narration
- XR trigger → Antigravity

XR Layer

- immersive environments
 - visual + sound + timing
-

11. First Prototype Scope (VERY IMPORTANT)

Define clearly:

The first prototype will include:

- 1 emotional state detection (basic)
- 1 experience (e.g., nature)
- basic narration
- simple reflection

👉 This prevents overbuilding.

12. Constraints & Safety

- No medical advice
 - No diagnosis
 - No medication suggestions
 - Focus only on emotional calming
-

13. Goal of Prototype

To demonstrate an emotionally aware AI that can:

- interact naturally
 - select a calming experience
 - narrate during immersion
 - provide reflective output
-

What you do AFTER this document

Once this is done:

Step 2

Create:

- conversation scripts

Step 3

Create:

- decision tree (logic flow)

Step 4

Build:

- one working loop (Deepgram + simple AI + Antigravity scene)
-

Final clarity

This document is your:

 **AI blueprint**

Without it:

- your AI will feel random
- your narration will feel disconnected
- your system won't scale

With it:

- everything becomes structured
- your "AI brain" becomes buildable
